### A characterization of market quality for small capitalization US equities Charles Collver<sup>1</sup>

September 2014

This paper characterizes some aspects of market quality for small and mid capitalization stocks during 2013. First, it tabulates some widely-used summary market quality measures such as quoted and effective spreads and trading volume. Then it describes the aggregate displayed depth of the limit order book for these stocks.

#### Introduction

During 2013, US-listed, US-domiciled small cap stocks with capitalizations below \$1 Billion were much less liquid than stocks with capitalizations between \$1 Billion and \$5 Billion. Small cap stocks had larger quoted and effective spreads and traded much lower volumes than mid cap stocks. They also showed lower depth at the inside quotes and beyond. Liquidity improved with market capitalization: the smallest stocks with capitalizations below \$100 Million exhibited the least liquidity and mid cap stocks with capitalizations between \$2 Billion and \$5 Billion exhibited the greatest liquidity.

The Jumpstart Our Business Startups Act ("JOBS Act") of 2012 directed the SEC to study how decimalization affected the liquidity and trading of small capitalization companies. Among other contributions, the resulting July 2012 Decimalization Report summarized academic literature on the impact of decimalization on small and mid cap stock liquidity. The Decimalization Report suggested a public roundtable to collect recommendations on a pilot program to generate more data on the impact of decimalization on liquidity. Many participants in the Decimalization Roundtable expressed support for a pilot program to study the impact of wider tick sizes on small cap stock liquidity. On June 24, 2014 the SEC issued an order (the "Tick Size Pilot Order") directing US equity exchanges and the Financial Industry Regulatory Authority to act jointly to develop and file a tick size pilot plan.

An increased minimum quoted price increment will have a direct mechanical impact on two aspects of liquidity: quoted spread and the distribution of order book depth. In 2013, more than 41% of small capitalization stocks (with market capitalization less than \$1 Billion and price at least \$2) had mean daily quoted spreads of 4.5 cents or less. Nearly one-third of these (or 14% of the total sample of small cap

<sup>&</sup>lt;sup>1</sup> This memorandum was prepared for the Division of Trading and Markets (TM). stocks) had mean daily quoted spreads of 1.5 cents or less. On the other side of the spectrum, 25% had mean daily quoted spreads of 15 cents or more. Given the data reveal small capitalization stocks exhibit a very wide range of quoted spreads, it might be expected that changes in minimum tick sizes could affect one set of small capitalization stocks differently than another set.

This study provides some empirical evidence on the state of the limit order book for small and mid capitalization stocks during 2013, a full year of results for the period preceding the proposed pilot study. This paper begins by presenting quoted and effective spreads and dollar trade volume. Then it characterizes the aggregate depth of the limit order book on US exchanges.

#### Sample

The sample period includes every trading day in 2013. I source the list of US-listed, US-domiciled corporate stock tickers from the Center for Research in Security Prices (CRSP) daily stock database. Stocks are included in the daily sample if the closing price measured by CRSP is greater than or equal to \$2.00 and the market capitalization is less than \$5 Billion. On average, there are 2814 stocks in the sample during a typical trading day in 2013.

#### Methods

The basic unit of analysis is the ticker-day. I compute spreads from the intra-daily MIDAS trade and quote (SIP) files. This data is similar to the commercially available TAQ data with one important difference: timestamps are in microseconds instead of milliseconds. Quoted spread is the difference between the best ask price and best bid price. Relative quoted spread is the quoted spread scaled by the bid-ask midpoint. Effective spread is twice the absolute value of the difference between the trade price and the prevailing bid-ask midpoint. Relative effective spread is the effective spread scaled by the quote midpoint. Quoted spreads are duration-weighted and effective spreads are dollar value weighted. If the quoted spread is less than or equal to zero (i.e., the market is crossed or locked), the data point is excluded from the computation. If a trade occurs while a quoted spread results in a locked or crossed market for that ticker, the effective spread is dropped. I also filter the first five minutes of each day to avoid some of the irregularities associated with the opening auctions. I compute dollar volume for each ticker-day from the MIDAS trade and quote files, but without filtering the first five minutes of the trading day.

I compute depth from twelve of the thirteen MIDAS direct exchange feeds. For each ticker and day, I cumulate depth at the bid price and 49 one-penny increments below the bid price at the end of each one-minute interval from 9:30 am to 4:00 pm (1:00 pm on shortened trading days: July 3, November 29 and December 24). I cumulate depth at the ask price and 49 one-penny increments above the ask price

<sup>&</sup>lt;sup>6</sup> The purpose of this study is to characterize market quality for small capitalization stocks during 2013 and compare this market quality to that of mid capitalization stocks. The study does not evaluate any proposed market structure reforms. Nor does it advocate a position on any proposed reforms.

<sup>&</sup>lt;sup>7</sup> All of the intervals in this study are closed on (include) the left endpoint and open on (exclude) the right endpoint.

<sup>&</sup>lt;sup>8</sup> The CBSX feed is restricted to top-of-book data.

for the same one-minute intervals. There are a total of 390 equally spaced intra-daily depth snapshots in a typical trading day (210 on shortened trading days). Using the intraday snapshots, I compute the daily average depth in shares and dollars (price\*size) at each 0.5 cent increment and each 1 basis point increment from the bid-ask midpoint for each ticker. The four resultant average daily limit order books – shares/penny, shares/basis point, dollars/penny and dollars/basis point – form the basis for all of the order book summary statistics. I also compute daily average shares per penny away from the best bid and ask in a similar manner. <sup>9</sup>

This paper characterizes the market quality of small capitalization stocks. It also provides empirical analysis on mid cap stocks as a comparison to small cap stocks. However, liquidity tends to vary by price as well as capitalization. To ease exposition and facilitate comparisons stocks are split into six capitalization groups: less than \$100 Million, \$100 Million to \$250 Million, \$250 Million to \$500 Million to \$500 Million, \$100 Million to \$100 Million Were also priced below \$100 Million were a

-

<sup>&</sup>lt;sup>9</sup> In contrast to the SIP-based sample utilized to compute spreads, this sample excludes off-exchange activity but includes on-exchange odd lot orders and trades.

<sup>&</sup>lt;sup>10</sup> The choice of price and capitalization bins results from balancing multiple tradeoffs between meaningful comparisons, adequate sample size and sensible demarcations.

<sup>&</sup>lt;sup>11</sup> The bins with a low percentage of tickers with ADV less than one million (i.e., subsets of stocks that would not be included in the proposed pilot) tend to have few ticker symbols. The purpose of this study is to describe the liquidity and trading environment for typical small capitalization stocks and compare this liquidity to that of typical mid cap stocks. The relatively few ticker-days with ADV greater than one million shares are included in the current sample.

#### **Results and Analysis**

The purpose of this study is to characterize market quality for small and mid cap stocks in 2013. To provide a thorough view of liquidity across stocks with various prices and market capitalizations this study includes a large number of stocks. The main body of this study highlights a few characteristics of the tabulated data while also providing methods for the reader to formulate additional interpretations. Many of the results presented in this study are subsets of larger output datasets. For the curious and the thorough, these datasets are provided in an Appendix and are available in electronic format at <a href="http://www.sec.gov/marketstructure/research/small\_cap\_liquidity\_appendix.xlsx">http://www.sec.gov/marketstructure/research/small\_cap\_liquidity\_appendix.xlsx</a>. The ensuing analysis begins with some examples of average daily limit order books followed by a presentation of quoted and effective spreads along with trade volume. The analysis concludes with an examination of displayed order book depth.

#### **Cumulative Order Book Depth Examples**

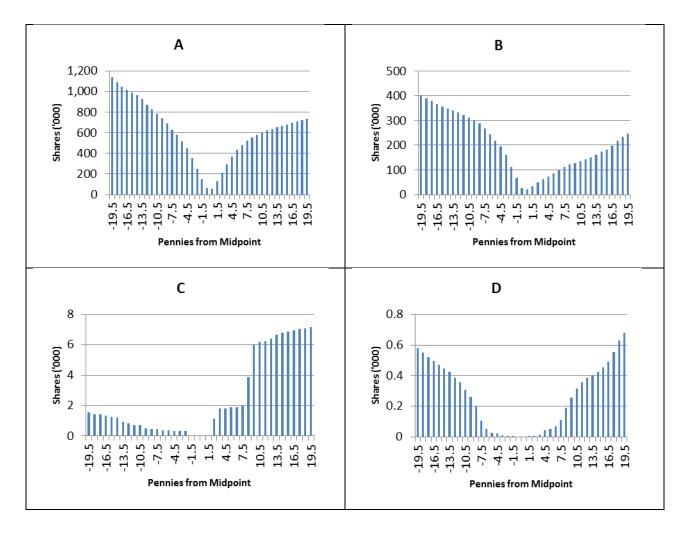

Figure 1 provides some anonymized examples of average cumulative depth in shares per penny away from the quote midpoint for four corporate stocks on August 13, 2013:

- Stock A is a liquid large capitalization stock with a market capitalization of approximately \$246 Billion and a closing price of \$24.20. It traded over 28 million shares and had an average quoted spread of one cent on August 13. The chart shows substantial depth available outside of the best bid and offer.
- Stock B is a small capitalization stock with a market cap of \$350.7 Million and a closing price of \$3.04. It traded over 2 million shares and had an average quoted spread of one cent on August 13. This chart, too, shows substantial depth available outside of the best bid and offer.

- Stock C had a market cap of \$115.4 Million and closed at \$8.90. It traded 20,568 shares and had an average quoted spread of \$0.042 on August 13. This stock has little incremental depth available on the bid side. Cumulative depth improves by about 400 shares at the average ask plus one cent. Average cumulative depth does not improve again until 8 cents above the midpoint.
- Stock D had a market capitalization of \$536.2 Million and a closing price of \$32.52. It traded 15,779 shares and had an average quoted spread of \$0.193. While the average depth inside the average quoted spread is low (as expected), cumulative depth increases somewhat at prices away from the best bid and offer. However, cumulative depth at increments twice the quoted half spread is only 2 to 3 times the depth available at the best bid and offer.

Stock A is a very liquid large capitalization stock. Stock B, though a small capitalization stock, displays many of the features of a liquid large cap stock: substantial trading activity, a one cent spread and considerable depth away from the best bid and offer. It is one of the few small cap stocks that would not meet the 1 million share ADV requirement for potential inclusion in the pilot. Stock C is a small capitalization stock with an average quoted spread less than five cents. While the average quoted spread would necessarily widen if included in one of the pilot test groups, it is not clear if cumulative depth on the coarser grid would change. Occasionally, quoted spreads in Stock D are smaller than average. But Stock D tends to have 200 or fewer shares available at spreads less than 15 cents.

Figure 1: Examples of Mean Cumulative Depth of the Order Book on August 13, 2013

#### **Spreads and Volume**

Standard measures of liquidity include quoted and effective spreads and dollar trading volume. During 2013, the sample of stocks with market capitalizations less than \$1 Billion had much larger spreads than mid cap stocks with market capitalizations ranging from \$1 to \$5 Billion, and, the smallest stocks have exceptionally large spreads. Table 2 provides mean and median quoted spread in cents and relative quoted spread in percent for the thirty capitalization-price bins. Average and median quoted spreads decline monotonically with capitalization for each price range and rise monotonically with price within each capitalization bin. Relative spreads exhibit a similar pattern. Exceptions occur when the spreads appear to be constrained by the minimum price increment. Capitalization-price bins where the median duration-weighted quoted spread is close to the minimum price increment are marked with a bold outline. Median quoted spreads range from 6.22 to 113.52 cents for the smallest stocks and from 1.00 to 5.77 cents for stocks with capitalizations between \$2 Billion and \$5 Billion. Median relative quoted

-

 $<sup>^{12}</sup>$  These are also the bins of stocks most likely to have traded more than 1 million shares per day. See Table 1.

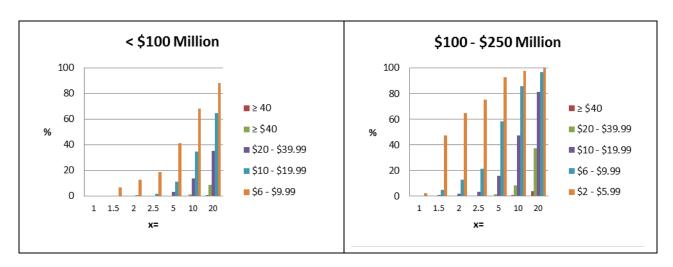

spreads range from 1.749% to 2.641% for the smallest stocks and from 0.066% to 0.237% for stocks with capitalizations between \$2 Billion and \$5 Billion.

Figure 2 provides some insight into the distribution of quoted spread for stocks within a capitalization-price bin by showing the percentage of ticker-days with mean quoted spreads less than or equal to some particular prices. As expected, high-priced stocks tend to show the least liquidity by this measure: within a particular capitalization bin and fixed quoted spread, the percentage of ticker-days increases as price declines. Smallest stocks show the least liquidity. For example, 94.2% of all ticker-days in the \$2 Billion to \$5 Billion capitalization - \$10 to \$19.99 price bin have quoted spreads less than or equal to 2 cents. This percentage is only 72.9% for the same price levels in the \$1 Billion to \$2 Billion bin, 34.9% in the \$500 Million to \$1 Billion bin, 7.2% in the \$250 Million to \$500 Million bin, 1.9% in the \$100 Million to \$250 Million bin, and 0.3% in the < \$100 Million bin. A similar pattern is apparent for other price range bins and quoted spread levels: the percentage of ticker-days with quoted spreads less than some fixed amount declines as capitalization declines while holding stock price range constant. This pattern breaks down somewhat as the percentage of ticker-days reaches the maximum of 100%.

<sup>&</sup>lt;sup>13</sup> Additional supporting tables, including tables of quoted spread, relative quoted spread, effective spread, and relative effective spread are included in Appendix Table 1. This table contains results for several more spreads in addition to those displayed in Figure 2.

<sup>&</sup>lt;sup>14</sup> Appendix Table 1 Panel C shows this monotonic relation between percentage of ticker days and price does not hold for relative quoted spreads.

Figure 2 and the accompanying Appendix Table 1 also provide more direct evidence on current minimum tick size constraints. On average, 52 ticker-days (1.9% of the sample) have a mean quoted spread less than or equal to 1 cent. These stocks are constrained the full day. Another 478 ticker-days (15.1% of the sample) have mean quoted spreads less than or equal to 1.5 cents. These stocks are constrained at least part of the day. However, these results reflect the activity of a variety of stocks over a full year. Table 3 shows the number of tickers that were fully and partially constrained for at least one day and the number of tickers that were constrained for more than half of the days in 2013. Twenty-five tickers were fully constrained by the 1 penny minimum price increment for at least half of the days in 2013. A total of 361 unique tickers were fully constrained for at least one day. Exactly 327 tickers were either fully or partially (more than half of a day) constrained for at least half of the days in 2013. A total of 1,534 unique tickers were either fully or partially constrained for at least one day. <sup>15</sup>

\_

<sup>&</sup>lt;sup>15</sup> Stocks can migrate from one capitalization-price bin to another over the course of a full year. The count of unique tickers is less than the count of ticker-days that were constrained for at least one day.

Figure 3 shows the behavior of mean quoted spreads for stocks priced from \$10.00 to \$19.99 over the entire year. While quoted spreads exhibit some variability over time, the averages in Table 2 are a good representation of their overall time series behavior. The chart portrays vast differences in average quoted spread across size ranges with the smallest stocks in the sample exhibiting the least liquidity and the largest stocks exhibiting the most liquidity. The chart also shows that the monotonic relation between average size and average spreads for 2013 is not violated on any day of the sample – the time series plots of daily averages for each size bin never cross.

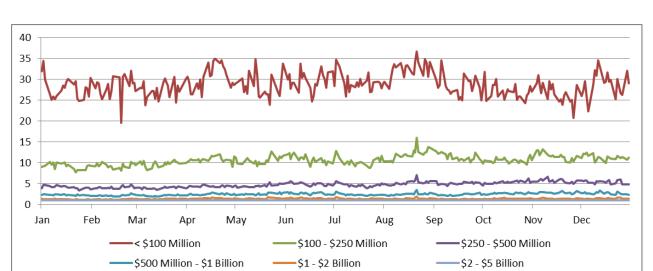

Figure 3: Quoted Spread for Stocks Priced \$10.00 to \$19.99

Table 4 provides mean and median effective spread in cents and relative effective spread in percent. Average and median effective spreads also tend to decline monotonically with capitalization for each price range and rise monotonically with price within each capitalization bin. A similar pattern occurs with relative effective spreads with the same exceptions apparent in relative quoted spreads. Median effective spreads range from 3.99 to 56.00 cents for the smallest stocks and from 0.88 to 3.15 cents for stocks in the \$2 to \$5 Billion capitalization range. Median relative effective spreads range from 0.922% to 1.235% for the smallest stocks and from 0.045% to 0.210% for stocks in the \$2 to \$5 Billion capitalization range. The last two panels of Table 4 show the ratio of effective to quoted spread in percent. In general, the effective spread is closer to the quoted spread in lower priced stocks.

Figure 4 shows the distribution of effective spreads for each capitalization-price bin. The percentage of ticker-days with mean effective spreads less than or equal to some fixed amount tends to decline with price and increase with capitalization. General exceptions include stocks with market capitalizations below \$500 Million and prices above \$40, and the 1 - 3 cent columns for stocks with capitalizations below \$100 Million.

Figure 4: Percentage of Ticker-Days with Mean Effective Spread less than or equal to 'x' cents

Smaller capitalization stocks tend to trade lower dollar volumes than larger capitalization stocks. Table 5 shows the average and median daily trading volume for each capitalization-price bin. Most stocks in the < \$100 Million capitalization bin trade less than \$25,000 during a typical trading day in 2013. Median daily dollar volume traded ranges from \$9,000 to \$25,000 for the smallest stocks and from \$13,599,000 to \$20,577,000 for stocks in the \$2 to \$5 Billion capitalization range. Median dollar volume traded increases when moving from the smallest to largest stocks in the sample. The increase is most substantial when moving from stocks with market capitalizations below \$100 Million to stocks with market capitalizations ranging from \$100 Million to \$250 Million.

-

 $<sup>^{16}</sup>$  On average, approximately 30% of the stocks in the \$2 Billion to \$5 Billion capitalization range trade more than 1 million shares on a typical day.

#### **Aggregate Order Book Depth Characterization**

On average, the smallest capitalization stocks have much less displayed size at all levels of the order book when compared to larger capitalization stocks. Figure 5 depicts average cumulative order book depth for each of the six capitalization ranges. While the overall shapes of the graphs are similar, the change in scale clearly shows the increase in depth with increasing market capitalization. An analogous set of charts for price ranges shows much less variation in average depth across the five price bins. While depth does vary with price, the relationship between depth and price is most evident when conditioned on capitalization.

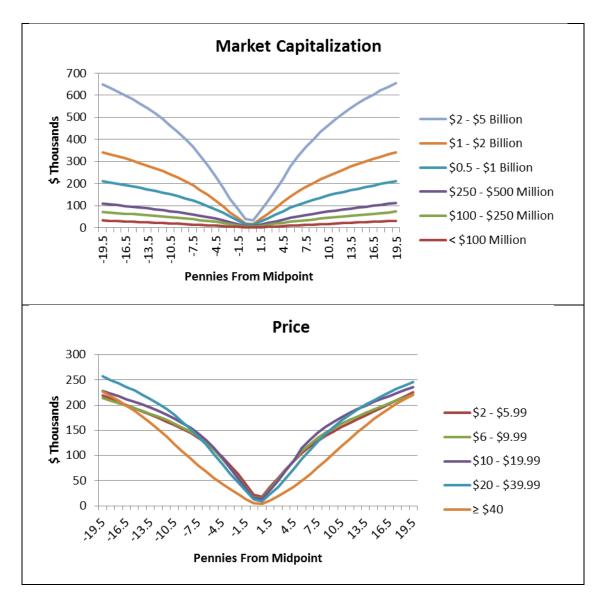

Table 6 provides average cumulative order book depth in thousands of dollars. Small capitalization stocks exhibit much less depth than stocks in the \$2 to \$5 Billion capitalization range. The smallest stocks (< \$100 Million capitalization) exhibit displayed depth on the order of 0.2 to 1.1 per cent of the depth for similarly priced stocks in the \$2 to \$5 Billion capitalization range. To Depth relative to stocks in the \$2 to \$5 Billion capitalization bin ranges from 0.4% to 4.1% for stocks in the \$100 to \$250 Million capitalization bin, from 4.7% to 11.1% for stocks in the \$250 Million to \$500 Million capitalization bin, from 13.1% to 20.1% for stocks in the \$500 Million to \$1 Billion capitalization bin, and from 20.6% to

\_

<sup>&</sup>lt;sup>17</sup> Additional supporting data, including results for combinations of shares/penny, shares/basis point, dollar volume/penny and dollar volume/basis point are included in Appendix Tables 2 and 3. These tables contain several price points in addition to those displayed in Table 6.

44.1% for stocks in the \$1 Billion to \$2 Billion capitalization bin. High-priced stocks (stocks with prices \$40 and above) exhibit especially low relative depth.

Another feature of Table 6 is the substantial depth available at prices away from the midpoint. For example, there is \$66,700 available within 1 cent of the midpoint for stocks priced between \$10 and \$19.99 in the \$1 Billion to \$2 Billion capitalization bin. Within 2.5 cents, there is \$216,700 available — more than three times the depth available at 1 cent. These averages represent the impact of both the increase in depth at prices away from the midpoint for stocks with low average spreads and the inclusion of additional stocks with wider bid-ask spreads in the averaging process.

Table 7 provides a view of limit order book depth in terms of multiples of the depth available at the best bid and ask prices. <sup>18</sup> The results portrayed in Table 7 further highlight the cumulative depth available at one or two cents away from the best bid and ask irrespective of the spread. For example, it answers the question: How far into the order book would a trader have to go to obtain twice the depth available at the best price? The average depth available at the best ask price in the smallest stocks with prices between \$10 and \$19.99 is 664 shares. On average, 1.8 times more shares are available at the ask and the ask plus one cent and more than twice as many shares are available at the three best (lowest) ask prices than at the best ask alone. Cells outlined in bold represent the fewest cents away from the best (inside) prices at which at least twice the amount of inside shares are available. <sup>19</sup> In most cases, the three best prices are required to double the depth at the best price. The smallest stocks show the least increase in cumulative depth away from the best prices. The cumulative depth available within 2 cents of the best prices ranges from 1.2 to 3.0 times the depth available at the best bid and offer for the smallest stocks, and, from 2.1 to 3.8 times the inside depth for stocks in the \$2 Billion to \$5 Billion capitalization bin.

<sup>&</sup>lt;sup>18</sup> Appendix Table 4 provides results for several more price points and for median depth in addition to mean depth. <sup>19</sup> There are five cases in Table 7 where a doubling of the inside depth occurs at the bid minus 9 cents or the ask plus 9 cents and another two cases where a doubling does not occur within 9 cents of the best prices. In these cases, Appendix Table 4A provides a more precise estimate of the average minimum number of cents away from the best prices required to double the inside depth.

#### **Distribution of Depth**

Many small capitalization stocks exhibit very little depth at 1, 2 and 5 cents away from the midpoint. While Table 6 provides average dollar depth for particular combinations of capitalization and price, Figure 6 provides some insight into the distribution of depth for stocks within a capitalization-price bin. Figure 6 shows the percentage of ticker-days in a capitalization-price bin with less than \$5,000 displayed liquidity within various increments away from the midpoint. <sup>20,21</sup>

20

 $<sup>^{20}</sup>$  The median price for stocks in the CRSP database with SHRCD equal to 10 or 11 is between \$16 and \$17. Five thousand dollars is approximately 300 shares at the median stock price.

<sup>&</sup>lt;sup>21</sup> Appendix Tables 5 and 6 contain several more price points for both dollar volume/penny and dollar volume/basis point and four distinct dollar volumes: \$5,000, \$10,000, \$20,000, and \$50,000.

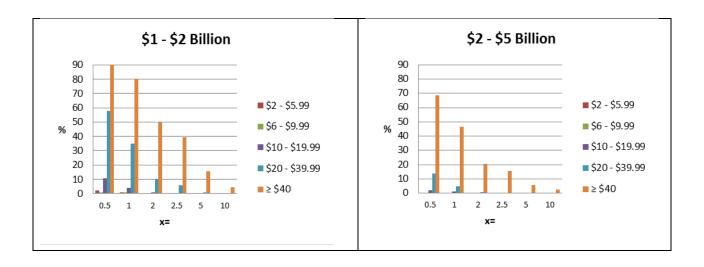

The current minimum price quote increment (MPI) in US stocks priced above \$1 is one cent.  $^{22}$  On the bottom axis, x=0.5 cents from the midpoint is consistent with the smallest spread possible with a 1 penny MPI. Similarly, x=1.0 cent from the midpoint is consistent with the smallest quoted spread for a 2 penny MPI, and x=2.5 cents from the midpoint maps to the smallest spread for a 5 penny MPI. For the smallest stocks priced from \$10 to \$19.99, 99.0% of the ticker-days had less than \$5,000 displayed within 0.5 cents of the midpoint. On the < \$100 Million panel of Figure 6, this is represented by the leftmost middle (purple) bar.  $^{23}$  Liquidity improves dramatically with capitalization. Nearly 95.0% of ticker-days for \$100 Million to \$250 Million capitalization stocks within the same price range (\$10 - \$19.99) have displayed liquidity of less than \$5,000. The percentages are 82.0% for \$250 Million to \$500 Million capitalization stocks, 43.6% for \$500 Million to \$1 Billion capitalization stocks, 10.8% for \$1 Billion to \$2 Billion capitalization stocks. Similar patterns of increasing liquidity with capitalization are apparent in other price ranges and for other price increments.

Figure 6: Percentage of Ticker-Days with less than \$5,000 within 'x' cents of the Midpoint

<sup>&</sup>lt;sup>22</sup> Currently, orders priced at \$1.00 or above must be priced in penny increments and orders for prices below \$1.00 can be priced in \$0.0001 increments.

<sup>&</sup>lt;sup>23</sup> See Panel A of Appendix Table 5.

Another feature of Figure 6 is the relationship between the percentage of ticker-days with less than \$5,000 displayed liquidity and the distance away from the spread midpoint when compared across capitalization bins. The average improvement in displayed liquidity at prices further away from the midpoint increases with market capitalization. Larger stocks experience proportionately fewer days with less than \$5,000 displayed liquidity at prices away from the midpoint than do smaller stocks. Again, for the smallest stocks priced between \$10 and \$19.99, the percentage of ticker-days with less than \$5,000 displayed liquidity declines from 99.0% to 97.9% (a 1.1% decline) when the increment is doubled from 0.5 to 1 cent, and to 94.4% (a 4.6% decline) when the increment is 2 cents. Moving up in capitalization for the same price range shows the decline is from 82.0% to 65.2% (a 20.5% decline) and then 36.1% (56% decline) for ticker-days in the \$250 Million to \$500 Million capitalization bin. The pattern is from 10.8% to 3.7% (65%) and then 0.9% (over 91%) when moving from 0.5 to 1 and 2 cent increments for ticker-days in the \$1 Billion to \$2 Billion capitalization bin. This pattern of increasingly improving average liquidity away from the midpoint for relatively larger stocks is apparent throughout Figure 6 (and Appendix Tables 5 and 6).

#### Conclusion

This study characterizes the extent of displayed liquidity for small capitalization stocks during 2013. The smallest stocks with market capitalization less than \$100 Million are exceptionally illiquid relative to larger stocks with capitalizations between \$1 Billion and \$5 Billion. They have wider quoted and effective spreads and trade lower dollar volumes. These measures tend to improve monotonically with market cap. The smallest stocks exhibit much less depth on average than stocks in larger capitalization ranges. Depth increases at prices just a few cents away from the midpoint, suggesting that there is more to liquidity than the size posted at the inside spread. But this increase in depth is more apparent in larger stocks. The distributions of many of these market quality measures confirm the anecdotal evidence portrayed in the example order books shown in Figure 1: there is substantial variation in liquidity measures among individual stocks within a specific capitalization-price category. These measures can be monitored for changes in the levels of the metrics or for differential impacts on various capitalization and price categories.

#### **Appendix**

#### **List of Tables**

Appendix Table 1: Spread Distributions

Panel A: Mean quoted spread Panel B: Mean effective spread

Panel C: Mean relative quoted spread Panel D: Mean relative effective spread

Appendix Table 2: Aggregate Limit Order Book Depth by Pennies

Panel A: Cumulative bid depth in shares by cents away from the midpoint

Panel B: Cumulative ask depth in shares by cents away from the midpoint

Panel C: Cumulative bid depth in \$ ('000) by cents away from the midpoint

Panel D: Cumulative ask depth in \$ ('000) by cents away from the midpoint

Appendix Table 3: Aggregate Limit Order Book Depth by Percent

Panel A: Cumulative bid depth in shares by basis points away from the midpoint

Panel B: Cumulative ask depth in shares by basis points away from the midpoint

Panel C: Cumulative bid depth in \$ ('000) by basis points away from the midpoint

Panel D: Cumulative ask depth in \$ ('000) by basis points away from the midpoint

Appendix Table 4: Aggregate Limit Order Book Depth by Pennies from the BBO

Panel A: Mean Panel B: Median

Appendix Table 5: Distribution of Cumulative Depth by Pennies

Panel A: Less than \$5,000 Panel B: Less than \$10,000 Panel C: Less than \$20,000 Panel D: Less than \$50,000

Appendix Table 6: Distribution of Cumulative Depth by Percent

Panel A: Less than \$5,000 Panel B: Less than \$10,000 Panel C: Less than \$20,000 Panel D: Less than \$50,000

Note: Tables available in Excel format at
